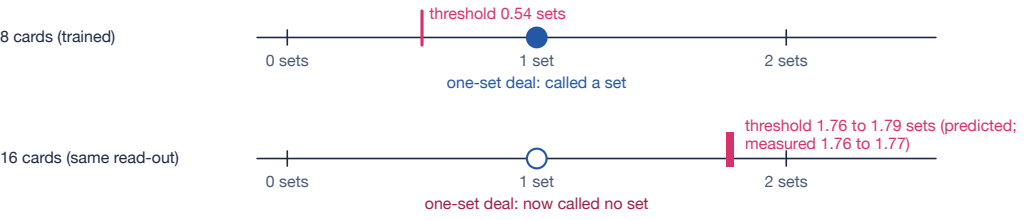
Newton's trained read-out, measured in sets: the same rule at 8 and at 16 table cards



From 8 to 16 cards one set's term shrinks by 28/120 = 0.23 and the root mean square by 0.44 (0.061 to 0.0266), so one set's normalised share falls to about half (0.23 / 0.44), while the other pairs' normalised baseline grows 2.3 times.
