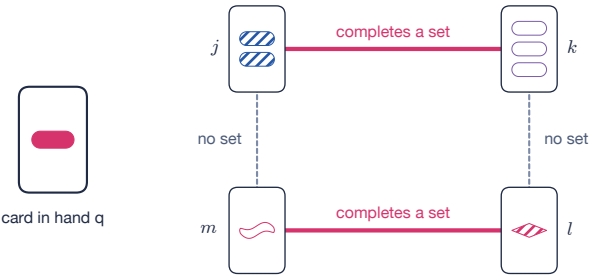
a A deal built from two completions



b Why no lookup can rank these pairs

A lookup scores a pair by $f(j) + f(k)$,

one score per card, given q.

If both set pairs beat both other pairs:

$f(j) + f(k) > f(k) + f(l)$, so $f(j) > f(l)$;

$f(l) + f(m) > f(j) + f(m)$, so $f(l) > f(j)$.

Both cannot hold: on this deal some

non-set pair scores at least as high

as some set pair.
